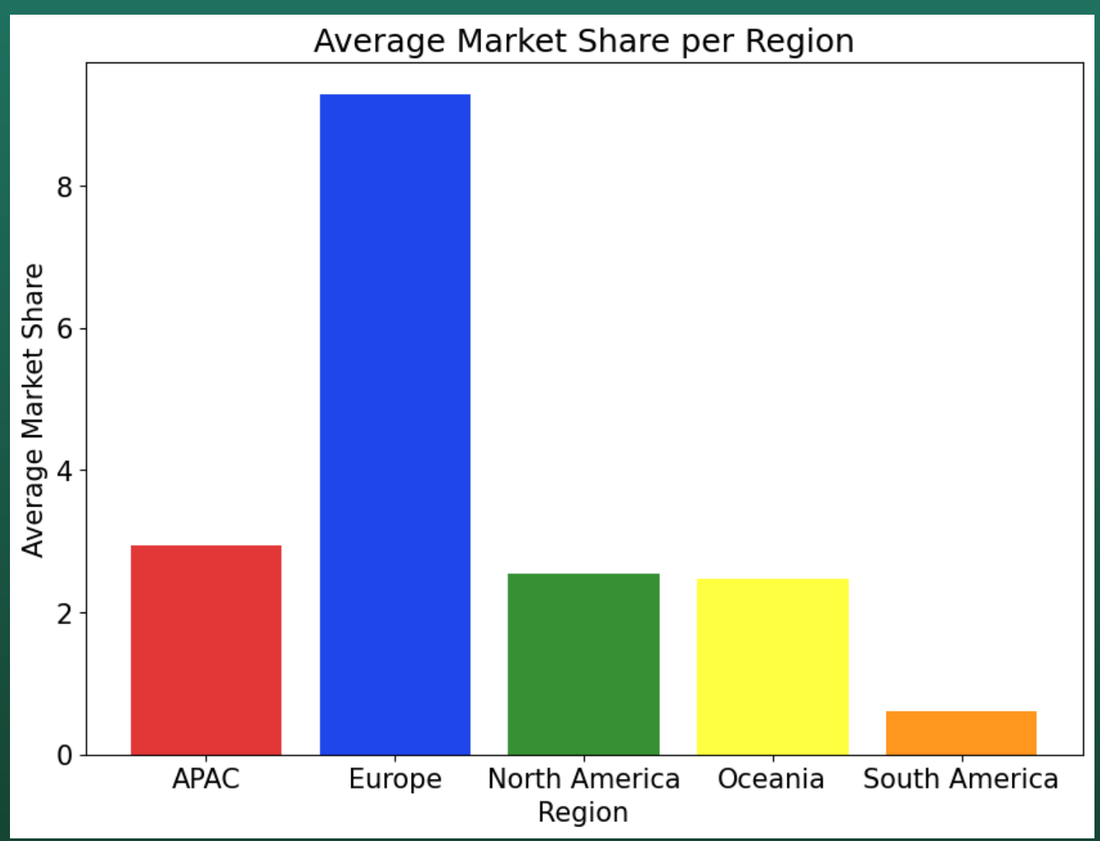

Fig 4: The average EV market share in each region.

Are Electric Vehicles (EVs) Taking over the Market?

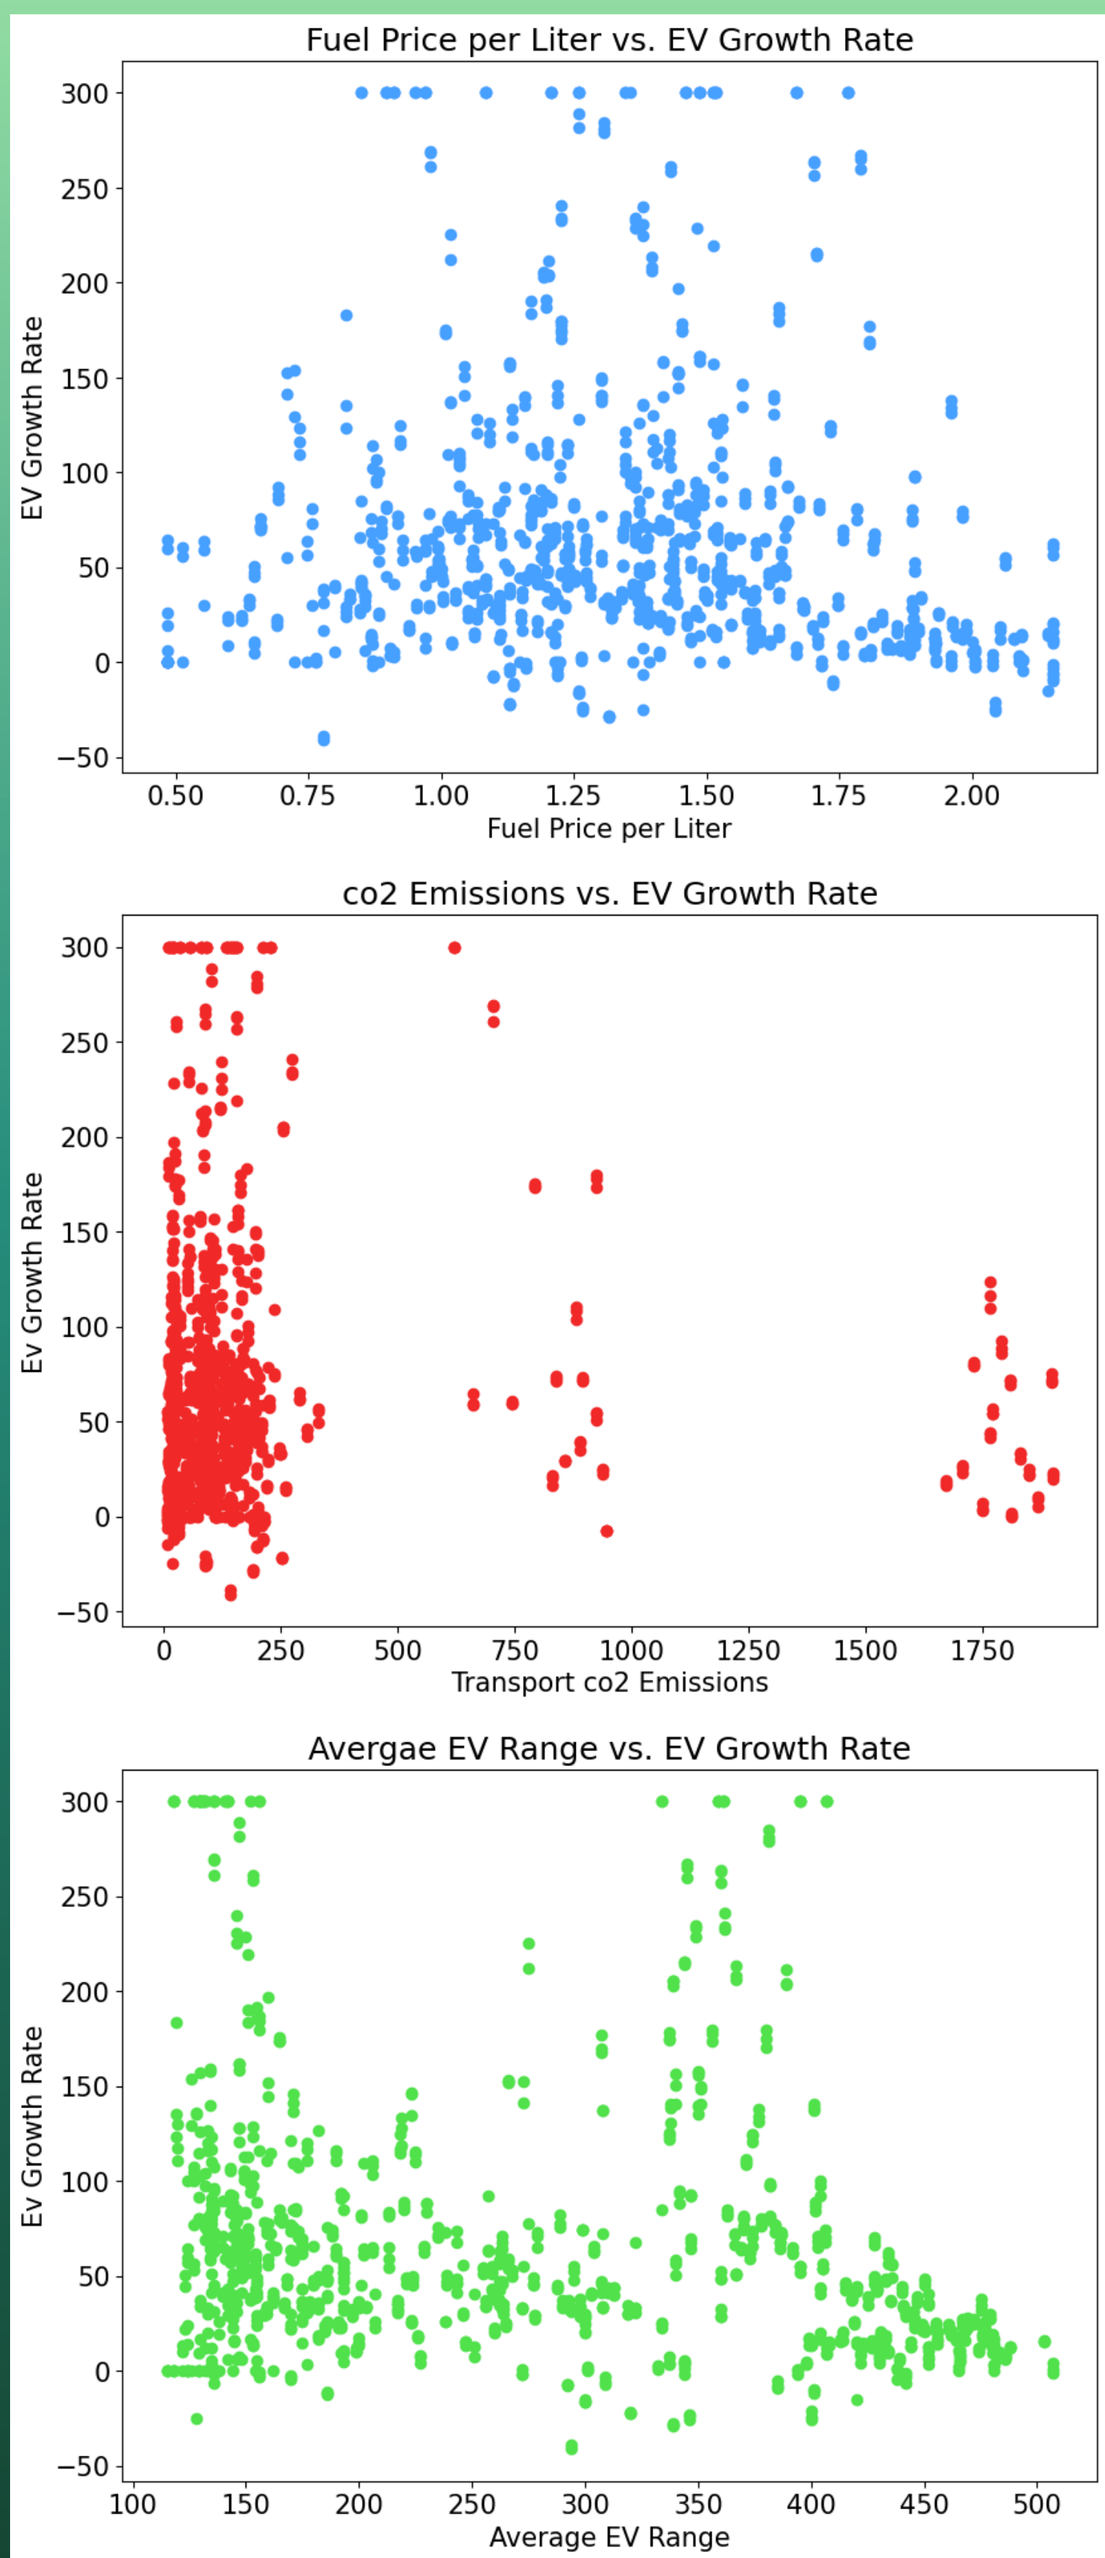

Fig 5: Possible driving factors for the EV growth rate.

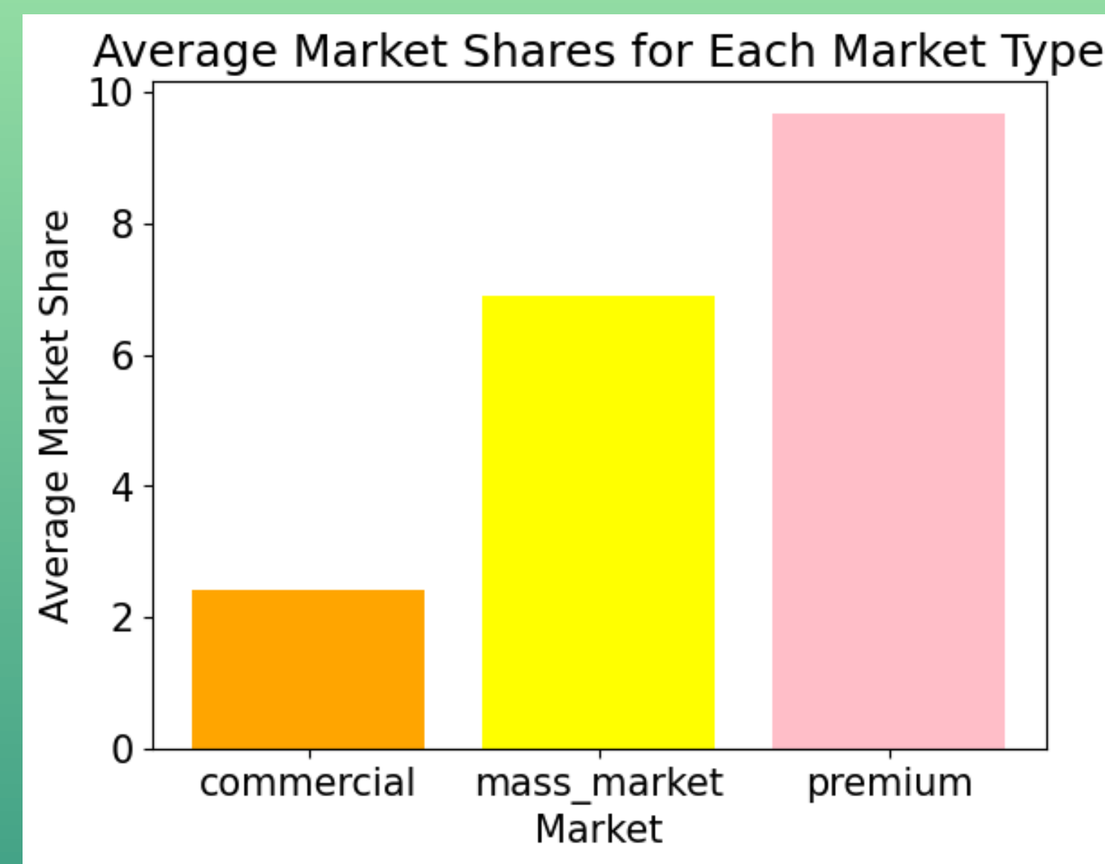

Fig 6: The average EV market share for each type of market.

What should be done?

The electric vehicle market is rapidly growing, especially in more recent years, shown by figure 1, so more resources should be allocated to the marketing of electrical vehicles and away from gas or diesel powered vehicles as those have established, unchanging markets. As established by figure 2, greater EV ranges, in other words: innovation, seem to provide a reason for the growing market, so more effort should be poured into developing longer lasting batteries and more efficient vehicle designs. These better designs will likely lead to an increase in customers and sales. These efforts should be focused in the premium and mass market sectors because they have larger, more established markets for EVs on average when compared to the commercial market according to figure 6. In the same way, these efforts should also be focused on Europe more than any other region because they have the largest market for electrical vehicles according to figure 4. Marketing should be maily focused towards countries with a greater GDP per capita because those countries have larger markets for electrical vehicles according to figure 3.
